

Successful: More than one repair initiators and repair are used to

Successfully repair a single trouble sources.

Unsuccessful: Trouble sources are not repaired with single or multiple repair initiator and repairs.

Complexity level: This is defined according to the presence of embedded or secondary trouble sources in the TSR sequence.

Simple: This contains a single trouble source.

Complex: This contains a primary trouble source and one of more embedded trouble sources; primary and embedded source each have their own associated repair initiators and repairs, embedded trouble source may arise from the production of misperceived or misunderstood repair initiators or repair associated with the primary trouble source.
